Section 1: Coding

1. Problem Statement

John and Mary are collaborating on a project that involves data analysis. They each have a set of age data, one sorted in ascending order and the other in descending order. However, their analysis requires the data to be in ascending order.

Write a program to help them merge the two sets of age data into a single sorted array in ascending order using merge sort.

Input Format

The first line of input consists of an integer N, representing the number of age values in each dataset.

The second line consists of N space-separated integers, representing the ages of participants in John's dataset (in ascending order).

The third line consists of N space-separated integers, representing the ages of participants in Mary's dataset (in descending order).

Output Format participants in Mary's dataset (in descending order).

The output prints a single line containing space-separated integers, which represents the merged dataset of ages sorted in ascending order.

Refer to the sample output for formatting specifications.

Sample Test Case

```
Input: 5
3579
    108642
    Output: 1 2 3 4 5 6 7 8 9 10
    Answer
    #include <stdio.h>
    #include <stdio.h>
    void merge(int arr[], int left[], int right[], int left_size, int right_size) {
      int i = 0, j = 0, k = 0;
      // Merge elements into arr
      while (i < left_size && j < right_size) {
        if (left[i] <= right[i]) {
           arr[k++] = left[i++];
        } else {
           arr[k++] = right[j++];
      }
      // Copy any remaining elements
      while (i < left_size) {
        arr[k++] = left[i++];
while (j < right_size) {
```

```
arr[k++] = right[j++];
                                                                                             240801268
                                                              240801268
      void mergeSort(int arr[], int n) {
        if (n < 2) return;
        int mid = n / 2;
        int left[20], right[20]; // Assuming max size is 20
        // Copy data to left and right subarrays
        for (int i = 0; i < mid; i++) {
           left[i] = arr[i];
for (int i = mid; i < n; i++) {

right[i - mid] = arr[i].
        mergeSort(left, mid);
        mergeSort(right, n - mid);
        merge(arr, left, right, mid, n - mid);
      }
 int main() {
    int r
        scanf("%d", &n);
        int arr1[n], arr2[n];
        for (int i = 0; i < n; i++) {
           scanf("%d", &arr1[i]);
        }
        for (int i = 0; i < n; i++) {
           scanf("%d", &arr2[i]);
        }
        int merged[n + n];
                                                                                             240801268
        mergeSort(arr1, n);
 merge(merged, arr1, arr2, n, n);
for (int i = 0 i < p + - 1 )
```

printf("%d	", merged[i]);

1. Problem Statement

Nandhini asked her students to arrange a set of numbers in ascending order. She asked the students to arrange the elements using insertion sort, which involves taking each element and placing it in its appropriate position within the sorted portion of the array.

Assist them in the task.

Input Format

The first line of input consists of the value of n, representing the number of array elements.

The second line consists of n elements, separated by a space.

Output Format

The output prints the sorted array, separated by a space.

Refer to the sample output for formatting specifications.

Section 1: Coding

1. Problem Statement

You are the lead developer of a text-processing application that assists writers in organizing their thoughts. One crucial feature is a charactersorting service that helps users highlight the most critical elements of their text.

To achieve this, you decide to enhance the service to sort characters in descending order using the Quick-Sort algorithm. Implement the algorithm to efficiently rearrange the characters, ensuring that it is sorted in descending order.

Input Format

The first line of the input consists of a positive integer value N, representing the number of characters to be sorted.

The second line of input consists of N space-separated lowercase alphabetical characters.

Output Format

The output displays the set of alphabetical characters, sorted in descending order.

Refer to the sample output for the formatting specifications.

```
Sample Test Case
    Input: 5
adgjk
    Output: k j g d a
    Answer
    #include <stdio.h>
    #include <string.h>
    // Function to swap two characters
    void swap(char *a, char *b) {
      char temp = *a;
      *a = *b;
      *b = temp;
    // Partition function for Quick Sort (descending order)
    int partition(char arr[], int low, int high) {
      char pivot = arr[high];
      int i = low - 1;
      for (int j = low; j < high; j++) {
        if (arr[j] > pivot) { // Sorting in descending order
           i++:
           swap(&arr[i], &arr[j]);
```

```
return (i + 1);
       swap(&arr[i + 1], &arr[high]);
     // Quick Sort function
     void quickSort(char arr[], int low, int high) {
       if (low < high) {
          int pivotIndex = partition(arr, low, high);
          quickSort(arr, low, pivotIndex - 1);
          quickSort(arr, pivotIndex + 1, high);
       }
     }
     // Function to display the sorted array correctly
     void displayArray(char arr[], int n) {
      for (int i = 0; i < n; i++) {
          printf("%c", arr[i]); // Print character
          if (i!=n-1) {
            printf(" "); // Print space only if it's not the last element
       printf("\n");
     int main() {
.....;
scanf("%d", &n);
       char characters[n];
       for (int i = 0; i < n; i++) {
          char input;
          scanf(" %c", &input);
          characters[i] = input;
       }
       quicksort(characters, 0, n - 1);
printf("%c ", characters[i]);
```

1. Problem Statement

Kavya, a software developer, is analyzing data trends. She has a list of integers and wants to identify the nth largest number in the list after sorting the array using QuickSort.

To optimize performance, Kavya is required to use QuickSort to sort the list before finding the nth largest number.

Input Format

The first line of input consists of an integer n, representing the size of the array.

The second line consists of n space-separated integers, representing the elements of the array nums.

The third line consists of an integer k, representing the position of the largest

number you need to print after sorting the array.

Output Format

The output prints the k-th largest number in the sorted array (sorted in ascending order).

Refer to the sample output for formatting specifications.
